

End to end: do we give TED's domains TED's labels?

Chopping and labelling combined. A domain counts as recovered when one of ours overlaps it at ≥ 0.8

- domain recovered, same label as TED
- recovered, different label
- domain not recovered (overlap < 0.8)
- recovered, same fold only
- recovered, no label

* exact lookup switched off and the domain's own TED sequence cluster removed from the MMseqs2 database: what a protein that is not in TED would get
